Technical Documentation

Auto Ticket Classification using FLOW DESIGNER

1.Introduction

This project demonstrates an automated ticket classification process in ServiceNow using Flow Designer. The workflow automatically classifies incoming tickets based on the configured conditions and updates the required ticket information.The project helps reduce manual work involved in classifying tickets and provides a structured process for handling incidents.

2. Project Objective

- Create a Flow Designer flow for the Standard Laptop request.
- Use the Service Catalog as the trigger for the flow.
- Create a Catalog Task automatically from the requested item.
- Set the task information for laptop configuration.
- Assign the task to the Hardware assignment group.
- Connect the flow to the Standard Laptop catalog item.
- Place a Standard Laptop order and verify the resulting Catalog Task.

3.Technology Used

- ServiceNow Platform
- Flow Designer
- Incident Management
- Flow Trigger
- Conditions
- Flow Actions
- Category & Subcategory
- Assignment Group

4. Project Workflow

The overall process is:

1. User creates a ticket/incident.
2. The ticket contains the required information.
3. The Flow Designer trigger detects the ticket.
4. The flow checks the configured conditions.
5. The ticket is automatically classified.
6. Category and subcategory are updated.
7. The ticket can be assigned to the appropriate assignment group.
8. The final ticket record is opened and verified.

5. Milestone 1 – Create the Flow

5.1 Create Flow

- Open ServiceNow.
- Select All and search for Flow Designer.
- Open Flow Designer under Process Automation.
- Select New and choose Flow.

- Enter the Flow Name as Auto Ticket Classification.
- Set the required application.
- Configure the flow execution settings.
- Save the flow.

5.2 Configure the Trigger

- Click Add a trigger.
- Select the required ticket/incident trigger.
- Configure the trigger conditions.
- Click Done.

5.3 Configure the Action

- Under Actions, click Add an action.
- Add the required action for updating the ticket.
- Configure the conditions for identifying the ticket type.
- Set the appropriate Category.
- Set the appropriate Subcategory.
- Set the required Assignment Group, if applicable.
- Click Done.
- Save the flow.
- Activate the flow..

6. Milestone 2 – Assign the Flow to the Standard Laptop Catalog Item

- Open the Flow Designer flow.
- Check the trigger configuration.
- Add the required classification conditions.
- Configure the Category field.
- Configure the Subcategory field.
- Configure the Assignment Group if required.
- Save the changes.
- Activate the flow.

7. Milestone 3 – Place the Service Catalog Order and Verify Approval

- Select All and open the Incident/Ticket module.
- Create a new ticket.
- Enter the required ticket information.
- Submit the ticket.
- Allow the Flow Designer flow to execute.
- Open the created ticket.
- Check the Category and Subcategory.
- Check the Assignment Group.
- Verify that the ticket has been classified automatically.

8.Expected Final Result

After the ticket is created, the Flow Designer flow automatically checks the configured conditions and classifies the ticket.The appropriate ticket information such as Category, Subcategory, and Assignment Group is updated automatically according to the configured flow

9.Key Configuration Values

Field	Value
Flow Name	Auto Ticket Classification
Platform	ServiceNow
Automation Tool	Incident/Ticket
Classification	Automatic
Category	Configured based on condition
Subcategory	Configured based on condition
Assignment Group	Configured based on ticket type

10.Conclusion

The Auto Ticket Classification using Flow Designer project automates the classification of ServiceNow tickets. The flow checks the ticket information and automatically updates the required classification fields.This automation reduces manual effort, improves ticket organization, and provides a structured process for handling incoming tickets.

11. Project Summary for Presentation / Viva

“My project is Auto Ticket Classification using ServiceNow Flow Designer. When a user creates a ticket, the Flow Designer flow is triggered and checks the configured conditions. Based on the ticket information, the flow automatically classifies the ticket by updating the category, subcategory, and assignment group. This reduces manual classification and improves the ticket management process.”
